

Amendments To The Claims:

Please amend the claims as shown. Applicant reserves the right to pursue any cancelled claims at a later date.

1.-15. (canceled)

16. (new) A method for call forwarding after a call from a first telecommunication terminal is not accepted at a second telecommunication terminal, the method comprising:

entering a first called number associated to the second terminal at the first terminal, the number entered to establish a connection to the second terminal;

triggering a transfer of an identification inquiry message containing the first call number to an automatic telecommunication service in order to identify an alternative call number;

identifying a second call number associated to a third telecommunication terminal by a telecommunication service via an electronic directory system comprising a stored assignment specification; and

providing the second call number for establishing a connection between the first terminal and the third terminal.

17. (new) The method according to claim 16, wherein the transfer is triggered in response to a first input of a user at the first terminal.

18. (new) The method according to claim 17, wherein an attribute value is assigned in the directory system for the second call number.

19. (new) The method according to claim 18, wherein for the first call number the assignment specification includes an attribute value having the second call number.

20. (new) The method according to claim 18, wherein the assignment specification includes an attribute value, wherein the attribute value for the first call number is the same as the attribute value for the second call assignment specification.

21. (new) The method according to claim 16, wherein the connection setup between the first and third terminal is initiated automatically after identification of the second call number.

22. (new) The method according to claim 16, wherein the telecommunication service transfers identification results information to the first terminal in response to the identification inquiry message, the identification result information is provided to the first terminal via a display unit or via voice.

23. (new) The method according to claim 22, wherein the identification result information includes the second call number.

24. (new) The method according to claim 22, wherein after providing the identification result information to the first terminal, the user provides a second input to effect the connection setup to the third terminal.

25. (new) The method according to claim 22, wherein a central exchange includes the telecommunication service and/or the directory system.

26. (new) The method according to claim 22, wherein the telecommunication service and/or the directory system is distributed over a plurality of central exchanges.

27. (new) The method according to claim 22, wherein the telecommunication service and/or the directory system is implemented in the first terminal.

28. (new) An arrangement including a plurality of telecommunication terminals, comprising:

a first terminal adapted to accept input of a user;

a directory system query unit configured for submitting a query to an electronic directory system in order to identify a second call number assigned to a first call number, the first call number previously entered at the first terminal; and

a forwarding control unit adapted to transfer the first call number to the directory system query unit after a first input of a user at the first terminal and to receive the second call number from the directory system query unit,

wherein the first terminal includes the forwarding control unit or

wherein an exchange includes the forwarding control unit.

29. (new) The arrangement to claim 28, wherein the first terminal includes the directory system query unit, or wherein the exchange includes the directory system query unit.

30. (new) The arrangement to claim 29, wherein after receiving the second call number, the forwarding control unit is configured for transferring a control command in order to trigger a connection setup from the first terminal to a third terminal that is associated to the second called number.

31. (new) The arrangement to claim 30,

wherein the first terminal is configured for automatically initiating the setup of a connection to the third terminal via the second call number, without a second input from the user, or

wherein the exchange is configured for automatically initiating the setup of a connection to the third terminal via the second call number, without a second input from the user.

32. (new) The arrangement to claim 28, wherein the first terminal includes a predefined key for accepting the first and/or a second input.

33. (new) The arrangement to claim 28, wherein the first terminal includes a display unit with assigned control keys for navigation and selection of a menu option from a menu displayed on the display unit.

Serial No. Not Yet Assigned

Atty. Doc. No. 2003P07108WOUS

34. (new) The arrangement to claim 28, wherein the first terminal includes a voice recognition system for recognizing a voice input of the first and/or a second input.
